## ANNEX D

Previously, the Nationality Act B.E. 2508 (1965) stipulates that Thai nationality can be obtained by birth, marriage or neutralization. However, there is a different condition of neutralization between women and men married with Thai nationals. For men who marry non-Thai nationals, their wives have the right to be accorded Thai nationality. In contrast, for women who marry non-Thai nationals, their husbands do not have this right and can acquire Thai nationality only by officially requesting neutralization. According to Section 10, such neutralization must have the following qualifications:

1) already attained majority according to Thai law and the law of their countries;
2) have good conducts;
3) have secured occupations;
4) have had residency in Thailand continuously until the date of application for the nationalization; and
5) know Thai at the level prescribed in the ministerial regulation.

Currently, the National Act (No. 4) B.E. 2551 (2008) with provision under Article 9 exempts foreign husbands of Thai nationals from fulfilling qualification number 4) and 5) above.

## ANNEX E

## Overall health situation of Thai women

1) According to the survey of the National Statistical Office, cancer is a leading cause of death among women, particularly breast cancer and cervical cancer. There are around 10,000 patients a year and 4,600 deaths from these causes. The Ministry of Public Health has taken proactive action to promote screening of cervical cancer nation-wide free of charge in all public hospitals. It is expected to reach 13 million women aged between 30-60 years old in five years (2011-2015). Regarding breast cancer, it was found that in 2007, $58.1 \%$ of women aged between 30-59 underwent breast examination, which $23.6 \%$ performed the examination by themselves and 20.3 \% by health professionals and 14.2 \% by themselves and health professionals. The percentage of women performing breast examination is slightly higher among women outside the municipal area, at 59.8 \% compared to 54.6 \% of women in the municipal areas.
2) Report of the Ministry of Public Health on the surveillance of non-communicable diseases in 2008, women have higher rates of diabetes and high blood pressure than men. Of a total of 645,620 people with diabetes undergoing treatment in hospitals, 433,784 were women and 211,836 were men. Of a total of $1,145,557$ people undergoing treatment of high blood pressure in hospitals in 2008, 716,592 were women and 428,965 were men.
3) According to the Department of Disease Control, the Ministry of Public Health on the HIV/AIDS situation, in 2009, it was found that HIV infection rates increased continuously in pregnant women since 2005. This ratio jumped to 0.18 per 100 per year in 2009 which was 3.6 times higher than the ratio in 2005 (most prevalent in pregnant women aged 22 years or less). In 2011, The analysis of overall AIDS patients ( $0-60$ years old) found that a man to a woman ratio was 2:1. However, in the 10-19 years old age group, the reverse was true with women to men ratio at 2:1. Unprotected sexual intercourse is the most risk factors of HIV transmission, accounting for
$84.03 \%$ of all risk factors ( $56.21 \%$ of homosexual men and $27.82 \%$ of homosexual women), followed by unknown factor ( $7.89 \%$ ), intravenous drug users (4.43 \%), mother-to-child transmission ( $3.62 \%$ ) and patients receiving blood transfusion $(0.02 \%)$, respectively.
